Surgilum, LLC Model RMSG2 (RoboMarker G2) for exclusive use with Surgilum, LLC Model TPSG2 (Robo Tip G2) – sold separately

Instructions for Use

Congratulations! Thank you for purchasing your RoboMarker G2. Please read these instructions carefully to achieve the best possible results.

Description: The RMSG2 RoboMarker provides an ergonomic handle to hold the disposable RoboTip at a prescribed angular position to apply reference marks to the surface of the cornea or adjacent conjunctiva. The handle maintains angular position using an enclosed system and includes a fixation light, projected target alignment lines, and a pendulum brace to aid in mark placement.

Specifications:

- Physicals: 87 mm long X 20 mm DIA, 95g, Stainless Steel Case
- Battery: IEC CR15H270 (CR2) 3V Lithium Metal (non-rechargeable), replaceable by user
- Fixation Light: Red centered
- Axis Dial: Illuminated 5-degree gradations with numeric reference lines. The horizontal axis is marked as "0" and the vertical axis is marked as "+90°".
- Pendulum Accuracy: Pendulum dial self-lights to within +/- 1 degree measured at the centerline of gradations with the handle in a horizontal position.
- Pendulum Brake: Toggle button, with activation force of 150 – 200 g that stops axis dial and marking tip rotation.
- Alignment Lines: Projected laser target pattern are aligned to coincide with marking tips touching the cornea. The circular area of the marker is 12mm when the marking tip is at the cornea surface.
- Laser: The RoboTip contains a lens diode emitting 650 nm light at a maximum power of 1mW. This product complies with 21 CFR Chapter 1, Subchapter J as a Class 1 laser product.

CALUTION: The use of optical instruments with this product may increase eye hazards.

Part Identification

1. Transferable dye marking edge.
2. Single-use RoboTip G2
3. Vertical Indicator Lines
4. Axis Dial
5. Axis Dial Button
6. Upper Housing
7. Mode Button
8. Set-up Button (color change/laser target brightness)
9. Lower Housing

Surgilum, LLC Model RMSG2 (RoboMarker G2) zur ausschließlichen Verwendung mit Surgilum, LLC Model TPSG2 (Robo Tip G2) – wird gesondert verkauft.

Gebrauchsanweisung

Herzlichen Dank! Vielen Dank, dass Sie sich für den RoboMarker G2 entschieden haben. Lesen Sie diese Gebrauchsanweisung aufmerksam durch, um bestmöglichste Ergebnisse zu erzielen.

Beschreibung: Der RMSG2 RoboMarker bietet einen ergonomischen Griff zur Aufnahme der Einweg-RoboTip in einer verschleißfreien Klemmposition für das Setzen von Referenzmarkierungen auf der Oberfläche des Hornhauts oder der Conjunktiva. Der Griff behält die Winkelposition mit Hilfe eines Pendelsystems bei. Darüber hinaus verfügt der Griff zur Unterstützung des Setzens von Markierungen mit einem Fixierungssystem, projizierte Ausrichtungslinien für das Setzen der Laserzeit an eine Brille für die Aktionen.

Technische Daten:

- Physikalisch: 87 mm lang X 20 mm Durchmesser, 95 g Größe
- Batterie: IEC CR15H270 (CR2) 3V Lithium-Metall (nicht-wiederaufladbare), austauschbar von Benutzer

Fixierungssystem: zentriert roter Pfeil am Stakenende mit einer numerischen Reference von 30 Grad. Die horizontale Achse ist "0" und die vertikale Achse "+90°" beschriftet.

• Orientierung: Der RoboMarker G2 pendelt frei und röhrt sich selbst im Bereich von 1 Grad, gemessen an der Mittellinie der Skalenleitung und dem Griff in waagerechter Position (+/- 15 Grad).

• Pendelbreite: Tastbare Masse mit einer Betätigungsstärke von >150-200 g, die die Achsenwinkel und die Rotation der Markierungsstange ermöglicht.

• Ausrichtungshilfe: Ein projiziertes Fadenkreuz und ein kreisförmiges Muster werden bei Bedarf der Hornhaut aufgelegt. Die Achsenwinkel sind auf der Markierungsstange zusammengefunden. Wenn sich die Markierungsstange auf der Oberfläche der Hornhaut befindet, beträgt der Durchmesser des Kreises 12 mm.

• Laser Sicherheit: Der RMSG2 enthält eine Laseroberfläche, die bei einer maximalen Leistung von 1 mW Licht in einer Wellenlänge von 650 nm emittiert. Dieser Prozess entspricht dem 21 CFR Kapitel 1, Unterkapitel J als Laserprodukt der Klasse 1.

ACHTUNG: Durch die Verwendung optischer Instrumente mit diesem Produkt wird die Gefahr für die Augen erhöht.

Teilezeichnung

1. Markierungskarte des übertragbaren Markierungsstabs
2. Einweg-RoboTip G2
3. Feineinstellung für die Anzeigelinien
4. Axis Dial
5. Axis Dial Button
6. Gehäusebrett
7. Gehäuseunterteil
8. Einrichtungsgeste (Änderung der Farbe/Helligkeit des Lasers)
9. Gehäuseunterteil

Surgilum, LLC Model RMSG2 (RoboMarker G2) para uso exclusivo con Surgilum, LLC Model TPSG2 (Robo Tip G2). Se venden por separado.

Instrucciones de uso

[Enhorabuena] Gracias por comprar el RoboMarker G2. Lea estas instrucciones detalladamente para lograr los mejores resultados posibles.

Descripción: El RMSG2 RoboMarker dispone de un mango ergonómico para sujetar la RoboTip G2 desecharable en una posición angular para aplicar marcas de referencia en la superficie de la córnea o la conjuntiva adyacente. El mango mantiene la posición angular mediante un sistema de pétalo cerrado e incluye una luz de fijación, líneas de alineamiento y un freno de péndulo que facilita la colocación de las marcas.

Especificaciones:

- Físicas: 87 mm de longitud X 20 mm de diámetro, 95 g de peso
- Batería: IEC CR15H270 (CR2) 3 V de litio-metálico (no recargable), reemplazable por el usuario
- Luz de fijación: Roja centrada
- Rueda de ejes: Graduaciones iluminadas de 5 grados con retroiluminación de 30 grados. El eje horizontal es marcado como "+0" y el eje vertical como "+90°".

• Precisión de alineamiento del eje: La rueda pendular se nivele en la línea central de los graduadores de +/- 15 grados.

• Pendiente: Pendiente de 150-200 g que define el giro de la rueda de ejes y la punta de la pera.

• Ayuda de alineamiento: Punto proyectado y el petate circular se alinean para coincidir con las puntas de marcado al tocar la córnea. La zona circular de 12 mm rodea el mango de la RoboTip G2 sobre sistemas de óptica.

• Seguridad láser: RMSG2 contiene un doble láser que emite una potencia máxima de 1 mW. Este producto cumple con el capítulo 1, subcapítulo 1, de la parte 1 del Código de las Radiaciones.

PRECAUCIÓN: El uso de instrumentos ópticos con este producto puede aumentar los riesgos para los ojos.

Identificación de la pieza

1. Borde de marcado con colorante transferible
2. RoboTip G2 en un solo uso
3. Líneas indicadoras Vermes
4. Rueda de ejes
5. Botón de freno de la rueda de ejes
6. carcasa superior
7. botón de modo
8. botón de configuración (cambio de color/brillo del objetivo)
9. carcasa inferior

Indications for Use: The RoboMarker G2 (RMSG2) and the RoboTip G2 (TPSG2) are used in combination as a corneal marking system. The system places highly accurate marks on the cornea or the conjunctiva to assist in surgery such as Toric Intracocular Lens alignment, Femto-Laser Cataract Surgery, Limbal Relaxing Incisions, and other refractive eye procedures.

Contraindications: DO NOT USE ROBOMARKER G2, ROBOTIPS G2, WITH ANY PATIENT THAT HAS SENSITIVITY OR ALLERGY TO GENTIAN VIOLET (CRYSTAL VIOLET) DYE.

ONLY USE THE G2 ROBOMARKER SYSTEM ON HEALTHY CORNEAS. DO NOT USE ON INFANTS.

CAUTION: The RoboMarker G2 should only be used by healthcare professionals.

The RoboMarker G2 Handle does not require sterilization for preoperative use. DO NOT attempt to sterilize. Sterilization will damage the RoboMarker G2 electronics and invalidate your warranty.

The RoboMarker G2 is a precision medical device that will adversely affect marking accuracy. When not in use, keep in clam shell case to prevent pocket debris from affecting marking bearing performance.

Only use the RoboMarker G2 for its intended use and as directed within these instructions.

The RoboMarker G2 is designed to hold the disposable RoboTip G2 with a 5-degree graduation scale with numeric reference lines. The horizontal axis is marked as "0" and the vertical axis is marked as "+90°".

Pendulum Accuracy: Pendulum dial self-lights to within +/- 1 degree measured at the centerline of gradations with the handle in a horizontal position.

Pendulum Brake: Toggle button, with activation force of 150 – 200 g that stops axis dial and marking tip rotation.

Alignment Lines: Projected laser target pattern are aligned to coincide with marking tips touching the cornea. The circular area of the marker is 12mm when the marking tip is at the cornea surface.

NOTE: The RoboMarker G2 has an autocenter to detect whether the G2 handle is level. When the projected target is "steady" (not flashing) the G2 handle is level and in the best position to mark the cornea.

NOTE: The RoboMarker G2 has a 12mm circle to detect whether the G2 handle is level. When the projected target is "steady" (not flashing) the G2 handle is level and in the best position to mark the cornea.

NOTE: The RoboMarker G2 has an autocenter to detect whether the G2 handle is level. When the projected target is "steady" (not flashing) the G2 handle is level and in the best position to mark the cornea.

NOTE: The RoboMarker G2 has an autocenter to detect whether the G2 handle is level. When the projected target is "steady" (not flashing) the G2 handle is level and in the best position to mark the cornea.

NOTE: The RoboMarker G2 has an autocenter to detect whether the G2 handle is level. When the projected target is "steady" (not flashing) the G2 handle is level and in the best position to mark the cornea.

NOTE: The RoboMarker G2 has an autocenter to detect whether the G2 handle is level. When the projected target is "steady" (not flashing) the G2 handle is level and in the best position to mark the cornea.

NOTE: The RoboMarker G2 has an autocenter to detect whether the G2 handle is level. When the projected target is "steady" (not flashing) the G2 handle is level and in the best position to mark the cornea.

NOTE: The RoboMarker G2 has an autocenter to detect whether the G2 handle is level. When the projected target is "steady" (not flashing) the G2 handle is level and in the best position to mark the cornea.

NOTE: The RoboMarker G2 has an autocenter to detect whether the G2 handle is level. When the projected target is "steady" (not flashing) the G2 handle is level and in the best position to mark the cornea.

NOTE: The RoboMarker G2 has an autocenter to detect whether the G2 handle is level. When the projected target is "steady" (not flashing) the G2 handle is level and in the best position to mark the cornea.

NOTE: The RoboMarker G2 has an autocenter to detect whether the G2 handle is level. When the projected target is "steady" (not flashing) the G2 handle is level and in the best position to mark the cornea.

NOTE: The RoboMarker G2 has an autocenter to detect whether the G2 handle is level. When the projected target is "steady" (not flashing) the G2 handle is level and in the best position to mark the cornea.

NOTE: The RoboMarker G2 has an autocenter to detect whether the G2 handle is level. When the projected target is "steady" (not flashing) the G2 handle is level and in the best position to mark the cornea.

NOTE: The RoboMarker G2 has an autocenter to detect whether the G2 handle is level. When the projected target is "steady" (not flashing) the G2 handle is level and in the best position to mark the cornea.

NOTE: The RoboMarker G2 has an autocenter to detect whether the G2 handle is level. When the projected target is "steady" (not flashing) the G2 handle is level and in the best position to mark the cornea.

NOTE: The RoboMarker G2 has an autocenter to detect whether the G2 handle is level. When the projected target is "steady" (not flashing) the G2 handle is level and in the best position to mark the cornea.

NOTE: The RoboMarker G2 has an autocenter to detect whether the G2 handle is level. When the projected target is "steady" (not flashing) the G2 handle is level and in the best position to mark the cornea.

NOTE: The RoboMarker G2 has an autocenter to detect whether the G2 handle is level. When the projected target is "steady" (not flashing) the G2 handle is level and in the best position to mark the cornea.

NOTE: The RoboMarker G2 has an autocenter to detect whether the G2 handle is level. When the projected target is "steady" (not flashing) the G2 handle is level and in the best position to mark the cornea.

NOTE: The RoboMarker G2 has an autocenter to detect whether the G2 handle is level. When the projected target is "steady" (not flashing) the G2 handle is level and in the best position to mark the cornea.

NOTE: The RoboMarker G2 has an autocenter to detect whether the G2 handle is level. When the projected target is "steady" (not flashing) the G2 handle is level and in the best position to mark the cornea.

NOTE: The RoboMarker G2 has an autocenter to detect whether the G2 handle is level. When the projected target is "steady" (not flashing) the G2 handle is level and in the best position to mark the cornea.
